Title 14

CHICAGO
ENERGY CONSERVATION CODE

Based on the 2018 International Energy Conservation Code®
Mayor’s Message

I am pleased to present the 2019 Chicago Construction Codes, which build on the City’s 150-year-long legacy of innovation, adaptation and dedication in public safety by bringing our city’s building regulations into the 21st century. Since establishing one of this nation’s earliest building codes in 1875, Chicago has championed construction quality and safety, implementing the nation’s first electrical code in 1883 and the first high-rise code for a major American city in 1975. After years of evolving to match the unique dense urban environment of our city, it is time for Chicago’s building code to take on the framework, terminology and consensus-based standards that are used throughout the country. User-friendly and universal, this modern family of codes will help ensure that every building on every block of Chicago is built safe, sustainable and vibrant.

With these new codes, Chicago joins a host of other major cities in aligning with the International Codes. Not only will this streamline the permitting process, it will reduce barriers to cost-effective construction, foster sustainable design and construction, and facilitate innovation among the building community to continue Chicago’s long-standing tradition for world-class architecture. Together with significant updates to our electrical and elevator codes implemented in 2018, and the full coordination of energy efficiency requirements with the building code, the updated Construction Codes bring safety and sustainability to the forefront of our efforts to maintain a resilient city.

As Chicagoans, it is our responsibility to ensure that the code addresses local contexts and successfully guides development and upkeep at every scale in every neighborhood. To improve the outdated one-size-fits-all approach of the previous code, this edition holds small buildings and high-rises to different standards, tightening requirements on high-rise buildings to accommodate innovations in engineering and materials while reducing barriers to rehabilitate and preserve the character of existing buildings that form the fabric of neighborhoods throughout the City.

I am pleased to acknowledge the city employees and many professionals from the private sector who contributed to the first full rewrite of the Chicago Building Code in 70 years. Commissioner Judith Frydland and Deputy Commissioner Grant Ullrich of the Department of Buildings ably led this monumental project with the support and assistance of the Departments of Fire, Health, Planning and Development, and the Mayor’s Office for People with Disabilities, as well as the International Code Council and more than 150 volunteer technical experts and industry leaders. With this modernized code, the city’s reputation for innovative design and world-renowned architecture can continue to thrive, and together, we can continue building a better Chicago community by community.

Sincerely,

[Signature]

Mayor
The 2019 Chicago Construction Codes reflect the City of Chicago’s commitment to enable safer, more cost-effective, sustainable, accessible, and innovative construction and rehabilitation of buildings in every neighborhood. Chicago has long been a leader in the field of building regulations, beginning with the establishment of one of the nation’s first building codes in 1875 and the first electrical code in 1883. Though there have been amendments over the years, the Chicago Construction Codes represent the first full rewrite of the Chicago Building Code since 1949.

In addition to enhancing safety and quality of life for residents and visitors of the City of Chicago, our mission at the Department of Buildings is to ensure city government is a reliable partner in helping homeowners, businesses, and developers complete construction and renovation projects by improving consistency, communication, and customer service in the permitting and inspection processes. The 2019 codes streamline the permitting process and move Chicago closer to national standards in several significant areas including building planning, fire and life safety, enclosures and materials, structural, small residential, and rehabilitation of existing buildings. In being more closely aligned with model codes and national standards, the new codes will speak the same language as building regulations adopted throughout the United States and promote greater use of green technologies and best practices for sustainable building design and construction.

Similar to the city’s new electrical and elevator codes, which were successfully implemented in 2018, the new Chicago Building Code and Chicago Building Rehabilitation Code retain several requirements from earlier codes that enhance building safety in Chicago’s unique local conditions and urban density, such as stricter limits on the use of combustible materials in large buildings.

Since becoming Building Commissioner in 2015, I have been overwhelmed by the willingness of so many in Chicago’s design, construction, and development communities to volunteer their time and resources to assist with development and implementation of important policy and program changes. The generosity and willingness to work toward consensus offered by so many of our industry partners, including those listed on the following pages, was essential to preparing and adopting the Chicago Construction Codes.

Because of continuing innovations in the construction industry, the Chicago Construction Codes will always remain a work in progress. I encourage you to reach out to the Department of Buildings if you have a suggestion for future changes or questions about how to apply any provision. We look forward to working with you.

Sincerely,

Judith Frydland
Building Commissioner
About the Chicago Construction Codes

Overview

The Chicago Construction Codes (Titles 14A through 14X of the Municipal Code of Chicago) are intended to provide clear, consistent, and coordinated requirements for the construction and maintenance of buildings and property in the City of Chicago. The Chicago Construction Codes are based on up-to-date model codes and standards with carefully-considered amendments to reflect local conditions and building practices. The Chicago Construction Codes are administered by several departments, but primary responsibility for development and enforcement is assigned to the Department of Buildings. The International Code Council® (ICC®) publishes the Chicago Construction Codes in user-friendly print and electronic formats on behalf of the City of Chicago. The National Fire Protection Association (NFPA) publishes the Chicago Electrical Code.

Individual Titles

The requirements of each title of the Chicago Construction Codes are interrelated and not intended to be applied separately. In developing the Chicago Construction Codes, efforts have been made to avoid unnecessary duplication across different titles. The Chicago Construction Codes are also designed to interact with the Chicago Zoning Ordinance. In case of a conflict between the Chicago Construction Codes and the Chicago Zoning Ordinance, the stricter provision governs. There are currently eleven full or interim titles:

- Administrative Provisions
- Building Code
- Conveyance Device Code
- Electrical Code
- Fire Prevention Code (Interim)
- Fuel Gas Code (Interim)
- Mechanical Code (Interim)
- Energy Conservation Code
- Plumbing Code (Interim)
- Building Rehabilitation Code
- Existing Building Requirements

The Chicago Construction Codes Administrative Provisions (Title 14A) establish uniform administrative procedures for each code in the Chicago Construction Codes series. These provisions establish the limits of the applicability of each code and describe how the codes are to be applied and enforced. These provisions also establish the powers and responsibilities of city employees, design professionals, construction professionals, and building owners with respect to application of the Chicago Construction Codes.

The Chicago Building Code (Title 14B) regulates the new construction of buildings and structures and other building- and property-related activities, including special inspections and tests, construction site safety, and building rehabilitation work, as specifically referenced in the other Chicago Construction Codes. The accessibility-related provisions of this code have been drafted to be consistent with the 2018 Illinois Accessibility Code and federal regulations for privately-funded construction.
The Chicago Conveyance Device Code (Title 14C) regulates the design, construction, installation, alteration, maintenance, and repair of conveyance devices, such as elevators, escalators, mechanical amusement riding devices, and their components.

The Chicago Electrical Code (Title 14E) regulates the installation and removal of electrical conductors, equipment, and raceways; signaling and communication conductors, equipment, and raceways; and optical fiber cables and raceways.

The Chicago Fire Prevention Code (Title 14F) regulates matters affecting or relating to protecting people and structures from the hazards of fire and explosion arising from the storage, handling, or use of specialized industrial processes, materials, or devices; conditions unusually hazardous to life, property, or public welfare in the use and occupancy of buildings or premises; and the maintenance and operation of fire protection and life safety systems. An interim version of this code, incorporating numerous fire-safety-related provisions of the Municipal Code of Chicago by reference, was adopted in April 2019. A comprehensively-updated code addressing fire prevention is expected in a future phase of code modernization.

The Chicago Fuel Gas Code (Title 14G) regulates the installation and operation of fuel gas (natural gas) piping from the point of utility delivery to the inlet connections of gas-fueled appliances and related accessories. An interim version of this code, incorporating existing fuel-gas-related provisions of the Municipal Code of Chicago by reference, was adopted in April 2019. A comprehensively-updated code addressing fuel gas is expected in a future phase of code modernization.

The Chicago Mechanical Code (Title 14M) regulates the installation, alteration, repair, and replacement of mechanical systems and equipment, including ventilating, heating, cooling, air-conditioning, and refrigeration systems, incinerators, and other energy-related systems. An interim version of this code, incorporating existing mechanical-system-related provisions of the Municipal Code of Chicago by reference, was adopted in April 2019. A comprehensively-updated code addressing mechanical systems is expected in a future phase of code modernization.

The Chicago Energy Conservation Code (Title 14N) regulates matters related to the design, construction, and rehabilitation of new and existing buildings for energy efficiency. This code has been drafted to be consistent with the 2019 Illinois amendments to the International Energy Conservation Code.

The Chicago Plumbing Code (Title 14P) regulates plumbing systems. An interim version of this code, incorporating existing plumbing-related provisions of the Municipal Code of Chicago by reference, was adopted in April 2019. A comprehensively-updated code addressing plumbing is expected in a future phase of code modernization.

The Chicago Building Rehabilitation Code (Title 14R) regulates the repair, alteration, change of occupancy, addition to, and relocation of existing buildings and structures. The accessibility-related provisions of this code have been drafted to be consistent with the 2018 Illinois Accessibility Code and federal regulations for privately-funded construction.

The Chicago Minimum Requirements for Existing Buildings (Title 14X) regulate the condition and maintenance of existing buildings, existing structures, and outdoors areas, and establish the respective responsibilities of owners and occupants to comply with these requirements. This code also establishes minimum requirements for providing light, ventilation, space, security, electricity, plumbing, heating, cooling, sanitation, weather protection, and fire protection in occupied buildings, and requirements for the maintenance of vacant structures. These requirements apply both prospectively and retroactively.

Unlike the International Codes® family, the Chicago Construction Codes do not (and are not intended to) include a separate code for one- and two-family residential buildings. Instead, one- to three-unit residential buildings up to four stories (single-family homes to three flats) are regulated in most titles of the Chicago Construction Codes as Occupancy Group R-5. There are numerous Chicago-specific exceptions applicable to Group R-5 occupancies. Additionally, in the Chicago Electrical Code, requirements for residential occupancies are collected in Article 560, and requirements applicable to the rehabilitation of residential buildings up to four stories are in Article 570.
Development and Adoption

In 2019, as part of a multi-year effort to comprehensively update regulations for the construction and maintenance of buildings, the City Council reorganized numerous building-related provisions of the Municipal Code into the Chicago Construction Codes. As part of this same effort, the City Council adopted new provisions aligned with the International Building Code® and International Existing Building Code®, which will be phased in between December 2019 and July 2020. Previously, in 2017 and 2018, the City Council adopted comprehensively-revised requirements for electrical installations and conveyance devices. In a future phase of this effort, the City of Chicago intends to update its requirements for mechanical systems, fuel gas, and plumbing, and adopt a comprehensively-revised fire prevention code.

The creation of the Chicago Construction Codes would not have been possible without the generous and continued support and encouragement of professionals and organizations working in the design, construction, and real estate industries. Numerous individuals contributed countless hours over several decades to lay the groundwork necessary for the comprehensive code modernization initiative launched by Commissioner Judy Frydland in 2015.

In 2017, the electrical industry took the lead in supporting a comprehensive overhaul of the Chicago Electrical Code, which was drafted by a dedicated team of technical experts with guidance from the reinvigorated Chicago Electrical Commission. In 2018, a new Chicago Conveyance Device Code, developed in consultation with elevator specialists and large building owners, was adopted. These successful efforts established a template for restarting efforts to align core provisions of the Chicago Building Code with the International Codes®.

In 2018, the Department of Buildings convened a distinguished cross section of industry leaders to launch the external phase of the consensus-based code development process. For several months, a dedicated team of volunteer architects and engineers, assigned to six subject-matter working groups, reviewed and debated draft provisions. A diverse group of stakeholder representatives provided regular feedback on their progress and provided insight on larger policy decisions. In all, more than 200 individuals contributed to the code development process and helped to build widespread support. The ordinance creating the Chicago Construction Codes was adopted by a unanimous vote of the City Council on April 10, 2019.

Maintenance

The City of Chicago is committed to ensuring the Chicago Construction Codes remain clear, consistent, and up to date. The Department of Buildings periodically proposes amendments to the Chicago Construction Codes for consideration by the City Council. Suggestions for potential amendments may be sent to the attention of the Commissioner of Buildings, 121 North LaSalle Street, City Hall Room 906, Chicago, Illinois 60602 or DOBCommissioner@cityofchicago.org. Information about recent amendments may be found on the Department of Buildings’ web site.

The Department of Buildings will continue to engage with industry stakeholders to develop protocols for ensuring continued alignment with model codes in the years ahead.

Section Numbering

The Chicago Construction Codes are part of the Municipal Code of Chicago and are subject to the general interpretive and organizational rules established in Chapter 1-4 of the Municipal Code. Provisions of the Municipal Code use a three-part numbering system, with each part separated by hyphens. The first part indicates the title in which the provision appears. The second part indicates the chapter within the title. The third part is a section designation:

>Title-[Chapter]-[Section]

The Chicago Construction Codes have been assigned title designations from 14A to 14X, with the letter-portion of the title designation correlated to the subject matter. Not all letters are currently used. Provisions of the Chicago Construction Codes may either be referred to in the formal three-part Municipal Code style, 14B-2-203, or more informally as Section 203 of the Chicago Building Code.
Italicized Terms

In each title of the Chicago Construction Codes (except the Chicago Electrical Code and Chicago Conveyance Device Code) italicized text is used to identify defined words and terms. Definitions, and additional rules governing code interpretation, are in Chapter 2 of each title.

Marginal Markings

In titles based on model codes published by ICC, Chicago-specific amendments are indicated by marginal markings. Provisions added or modified by Chicago are indicated with a double-ruled line (||) in the outer margin adjoining the text. Provisions deleted by Chicago are indicated with a carat (<) in the outer margin.

In the Chicago Electrical Code, Chicago-specific modifications and additions are indicated by shaded text. Chicago-specific deletions are indicated by a bullet (•) in the left-hand margin.

Revisions History

All ordinances adopted by the City Council are published by the City Clerk in the Journal of the Proceedings of the City Council of the City of Chicago (Council Journal) after each council meeting. As part of ICC and NFPA’s publication of the Chicago Construction Codes, the adoption and amendment history, along with a citation to the relevant page(s) of the Council Journal, is provided in a box beneath each section heading.

Editor’s Notes

When preparing this publication based on the ordinances adopted by the City Council, ICC occasionally identifies items which it believes to be typographic or editorial errors in the ordinance text. ICC reviews each of these items with the Department of Buildings. In the case of minor errors, such as clear spelling, capitalization, or punctuation errors, ICC has corrected the error in this text without note. Where any ambiguity exists, ICC will note the extent of any modification using an Editor’s Note immediately following the affected provision. ICC’s editorial revisions do not have the force of law. Where appropriate, the City Council will make corresponding corrections or clarifications through future legislation.

Publisher’s Errors

Pursuant to the adopting ordinances, individual titles of the Chicago Construction Codes may incorporate corrections to errors in the model code text identified by the model code publisher (errata). For specific information, review the ordinance provisions reproduced at the beginning of Chapter 1 of each code.

Disclaimer

This publication may not reflect the most current legislation adopted by the City of Chicago and may unintentionally vary, in material ways, from the official legislation. The publisher has prepared and provides this document for informational purposes only, and this document should not be relied upon as the definitive authority for legislation adopted by the City of Chicago. The publisher makes no guaranty or warranty as to the accuracy or completeness of any information published in this document. The publisher further disclaims liability for any personal injury, property, or other damages of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance on the publication of the Chicago Construction Codes.
Acknowledgments

The City of Chicago gratefully acknowledges the many individuals and organizations who have contributed to the development and adoption of the Chicago Construction Codes. Comprehensively updating Chicago’s construction requirements to better align with up-to-date model codes and standards used elsewhere in the United States while maintaining longstanding local requirements that are adapted to local conditions and practices has long been a goal of many working in the design and construction fields in Chicago. Over several decades, many committees, organizations, and individuals have studied how to accomplish this monumental task. The code modernization initiative launched in 2015 would not have been possible without the groundwork completed through these earlier efforts.

Every effort has been made to list all those who participated in the most recent efforts. Any errors or omissions in these acknowledgments are entirely unintended.

ELECTED OFFICIALS

Mayor of Chicago
Rahm Emanuel, 2011–2019

The City of Chicago also acknowledges the endless generosity of the New York City Department of Buildings and Fire Department in sharing material, insight, and moral support from their own efforts to adapt and apply national model codes to the realities of regulating construction in a city shaped by several centuries of dense urban development.

Thank you.
PREFACE TO THE MODEL CODE

Introduction

This code contains separate provisions for commercial buildings and for low-rise residential buildings (3 stories or less in height above grade). Each set of provisions, IECC—Commercial Provisions and IECC—Residential Provisions, is separately applied to buildings within its respective scope. Each set of provisions is to be treated separately. Each contains a Scope and Administration chapter, a Definitions chapter, a General Requirements chapter, a chapter containing energy efficiency requirements and existing building provisions applicable to buildings within its scope.

The I-Codes, including this *International Energy Conservation Code*, are used in a variety of ways in both the public and private sectors. Most industry professionals are familiar with the I-Codes as the basis of laws and regulations in communities across the U.S. and in other countries. However, the impact of the codes extends well beyond the regulatory arena, as they are used in a variety of nonregulatory settings, including:

- Voluntary compliance programs such as those promoting sustainability, energy efficiency and disaster resistance.
- The insurance industry, to estimate and manage risk, and as a tool in underwriting and rate decisions.
- Certification and credentialing of individuals involved in the fields of building design, construction and safety.
- Certification of building and construction-related products.
- U.S. federal agencies, to guide construction in an array of government-owned properties.
- Facilities management.
- “Best practices” benchmarks for designers and builders, including those who are engaged in projects in jurisdictions that do not have a formal regulatory system or a governmental enforcement mechanism.
- College, university and professional school textbooks and curricula.
- Reference works related to building design and construction.

In addition to the codes themselves, the code development process brings together building professionals on a regular basis. It provides an international forum for discussion and deliberation about building design, construction methods, safety, performance requirements, technological advances and innovative products.
Development

This 2018 edition presents the code as originally issued, with changes reflected in the 2000 through 2015 editions and further changes approved through the ICC Code Development Process through 2017. A new edition such as this is promulgated every 3 years.

This code is founded on principles intended to establish provisions consistent with the scope of an energy conservation code that adequately conserves energy; provisions that do not unnecessarily increase construction costs; provisions that do not restrict the use of new materials, products or methods of construction; and provisions that do not give preferential treatment to particular types or classes of materials, products or methods of construction.

Maintenance

The International Energy Conservation Code is kept up to date through the review of proposed changes submitted by code enforcement officials, industry representatives, design professionals and other interested parties. Proposed changes are carefully considered through an open code development process in which all interested and affected parties may participate.

The ICC Code Development Process reflects principles of openness, transparency, balance, due process and consensus, the principles embodied in OMB Circular A-119, which governs the federal government’s use of private-sector standards. The ICC process is open to anyone; there is no cost to participate, and people can participate without travel cost through the ICC’s cloud-based app, cdp-Access®. A broad cross section of interests are represented in the ICC Code Development Process. The codes, which are updated regularly, include safeguards that allow for emergency action when required for health and safety reasons.

In order to ensure that organizations with a direct and material interest in the codes have a voice in the process, the ICC has developed partnerships with key industry segments that support the ICC’s important public safety mission. Some code development committee members were nominated by the following industry partners and approved by the ICC Board:

- National Association of Home Builders (NAHB)
- National Multifamily Housing Council (NMHC)

The code development committees evaluate and make recommendations regarding proposed changes to the codes. Their recommendations are then subject to public comment and council-wide votes. The ICC’s governmental members—public safety officials who have no financial or business interest in the outcome—cast the final votes on proposed changes.

The contents of this work are subject to change through the code development cycles and by any governmental entity that enacts the code into law. For more information regarding the code development process, contact the Codes and Standards Development Department of the International Code Council.

While the I-Code development procedure is thorough and comprehensive, the ICC, its members and those participating in the development of the codes disclaim any liability resulting from the publication or use of the I-Codes, or from compliance or noncompliance with their provisions. The ICC does not have the power or authority to police or enforce compliance with the contents of this code.
Coordination of the International Codes

The coordination of technical provisions is one of the strengths of the ICC family of model codes. The codes can be used as a complete set of complementary documents, which will provide users with full integration and coordination of technical provisions. Individual codes can also be used in subsets or as stand-alone documents. To make sure that each individual code is as complete as possible, some technical provisions that are relevant to more than one subject area are duplicated in some of the model codes. This allows users maximum flexibility in their application of the I-Codes.

Adoption

The International Code Council maintains a copyright in all of its codes and standards. Maintaining copyright allows the ICC to fund its mission through sales of books, in both print and electronic formats. The ICC welcomes adoption of its codes by jurisdictions that recognize and acknowledge the ICC’s copyright in the code, and further acknowledge the substantial shared value of the public/private partnership for code development between jurisdictions and the ICC.

The ICC also recognizes the need for jurisdictions to make laws available to the public. All I-Codes and I-Standards, along with the laws of many jurisdictions, are available for free in a nondownloadable form on the ICC’s website. Jurisdictions should contact the ICC at adoptions@icc.org to learn how to adopt and distribute laws based on the International Energy Conservation Code in a manner that provides necessary access, while maintaining the ICC’s copyright.
EFFECTIVE USE OF THE
CHICAGO ENERGY CONSERVATION CODE

The Chicago Energy Conservation Code (CECC) regulates minimum energy conservation requirements for new and remodeled buildings. The CECC addresses energy conservation requirements for all aspects of energy uses in both commercial and residential construction, including heating and ventilating, lighting, water heating, and power usage for appliances and building systems.

The CECC is a design document. For example, before one constructs a building, the designer must determine the minimum insulation $R$-values and fenestration $U$-factors for the building exterior envelope. Depending on whether the building is for residential use or for commercial use, the CECC sets forth minimum requirements for exterior envelope insulation, window and door $U$-factors and SHGC ratings, duct insulation, lighting and power efficiency, and water distribution insulation.

Arrangement of the 2019 CECC

The CECC contains two separate sets of provisions—one for commercial buildings and one for residential buildings. Each set of provisions is applied separately to buildings within their scope. The CECC—Commercial Provisions apply to all buildings except for residential buildings four stories or less in height. The CECC—Residential Provisions apply to Group R-2, R-3, R-4 and R-5 buildings four stories or less in height. These scopes are based on the definitions of “Commercial building” and “Residential building,” respectively, in Chapter 2 of each set of provisions. Note that the CECC—Commercial Provisions therefore contain provisions for residential buildings five stories or greater in height. Each set of provisions is divided into five different parts:

The following is a chapter-by-chapter synopsis of the scope and intent of the provisions of the Chicago Energy Conservation Code and applies to both the commercial and residential energy provisions:

**Chapter 1 Scope and Administration.** This chapter contains provisions for the application, enforcement and administration of subsequent requirements of the code. In addition to establishing the scope of the code, Chapter 1 identifies which buildings and structures come under its purview. Users should also consult the Chicago Construction Codes Administrative Provisions for additional requirements related to administrative compliance with this code.

**Chapter 2 Definitions.** Chapter 2 is the repository of the definitions of terms used in the body of the code. Codes are technical documents and every word, term and punctuation mark can impact the meaning of the code text and the intended results. The code often uses terms that have a unique meaning in the code and the code meaning can differ substantially from the ordinarily understood meaning of the term as used outside of the code.

The terms defined in Chapter 2 are deemed to be of prime importance in establishing the meaning and intent of the code text. The user of the code should be familiar with and consult this chapter because the definitions are essential to the correct interpretation of the code and the user may not be aware that a term is defined.

Where understanding of a term’s definition is especially key to or necessary for understanding of a particular code provision, the term is shown in italics. This is true only for those terms that have a meaning that is unique to the code. In other words, the generally understood meaning of a term or phrase might not be sufficient or consistent with the meaning prescribed by the code; therefore, it is essential that the code-defined meaning be known.
Guidance regarding tense, gender and plurality of defined terms as well as guidance regarding terms not defined in this code is provided.

Chapter 3 General Requirements. Chapter 3 specifies the climate zones that will serve to establish the exterior design conditions. In addition, Chapter 3 provides interior design conditions that are used as a basis for assumptions in heating and cooling load calculations, and provides basic material requirements for insulation materials and fenestration materials.

Climate has a major impact on the energy use of most buildings. The code establishes many requirements such as wall and roof insulation $R$-values, window and door thermal transmittance ($U$-factors) and provisions that affect the mechanical systems based on the climate where the building is located. This chapter contains information that will be used to properly assign the building location into the correct climate zone and is used as the basis for establishing or eliminating requirements.

Chapter 4 Energy Efficiency. Chapter 4 of each set of provisions contains the technical requirements for energy efficiency.

Commercial Energy Efficiency. Chapter 4 of the CECC—Commercial Provisions contains the energy-efficiency-related requirements for the design and construction of most types of commercial buildings and residential buildings greater than four stories in height above grade. This chapter defines requirements for the portions of the building and building systems that impact energy use in new commercial construction and new residential construction greater than four stories in height, and promotes the effective use of energy. In addition to energy conservation requirements for the building envelope, this chapter contains requirements that impact energy efficiency for the HVAC systems, the electrical systems and the plumbing systems. It should be noted, however, that requirements are contained in other codes that have an impact on energy conservation. For instance, requirements for water flow rates are regulated by the Chicago Plumbing Code.

Residential Energy Efficiency. Chapter 4 of the CECC—Residential Provisions contains the energy-efficiency-related requirements for the design and construction of residential buildings regulated under this code. It should be noted that the definition of a residential building in this code is unique for this code. In this code, a residential building is a Group R-2, R-3, R-4 or R-5 buildings four stories or less in height. All other buildings, including residential buildings greater than four stories in height, are regulated by the energy conservation requirements in the CECC—Commercial Provisions. The applicable portions of a residential building must comply with the provisions within this chapter for energy efficiency. This chapter defines requirements for the portions of the building and building systems that impact energy use in new residential construction and promotes the effective use of energy. The provisions within the chapter promote energy efficiency in the building envelope, the heating and cooling system and the service water heating system of the building.

Chapter 5 Existing Buildings. Chapter 5 of each set of provisions contains the technical energy efficiency requirements for existing buildings. Chapter 5 provisions address the maintenance of buildings in compliance with the code as well as how additions, alterations, repairs and changes of occupancy need to be addressed from the standpoint of energy efficiency. Specific provisions are provided for historic buildings.

Chapter 6 Referenced Standards. The code contains numerous references to standards that are used to regulate materials and methods of construction. Chapter 6 contains a comprehensive list of all standards that are referenced in the code. The standards are part of the code to the extent of the reference to the standard. Compliance with the referenced standard is necessary for compliance with this code. By providing specifically adopted standards, the construction and installation requirements necessary for compliance with the code can be readily determined. The basis for code compliance is, therefore, established and available on an equal basis to the building official, contractor, designer and owner.
Chapter 6 is organized in a manner that makes it easy to locate specific standards. It lists all of the referenced standards, alphabetically, by acronym of the promulgating agency of the standard. Each agency’s standards are then listed in either alphabetical or numeric order based on the standard identification. The list also contains the title of the standard; the edition (date) of the standard referenced; any addenda included as part of the ICC adoption; and the section or sections of this code that reference the standard.

**Abbreviations and Notations**

The following is a list of common abbreviations and units of measurement used in this code. Some of the abbreviations are for terms defined in Chapter 2. Others are terms used in various tables and text of the code.
