About the International Code Council

The International Code Council® (ICC®) is a member-focused association dedicated to helping the building safety community and construction industry provide safe, sustainable, and affordable construction through the development of codes and standards used in the design, build, and compliance process. Most U.S. communities and many global markets choose the International Codes®. ICC Evaluation Service (ICC-ES), a subsidiary of the International Code Council, has been the industry leader in performing technical evaluations for code compliance fostering safe and sustainable design and construction.

About the Authors

Douglas W. Thornburg, AIA, CBO, is the Vice President and Technical Director of Products and Services at the International Code Council (ICC), where he provides leadership in the technical content development of ICC publications and educational programs as well as in the instruction for ICC building code seminars. Prior to joining the ICC in 2004, Mr. Thornburg served as a code consultant and educator for building codes. He has been involved extensively in building code activities since 1980.

Chris Kimball, SE, MCP, CBO, is currently the Vice President of West Coast Code Consultants, Inc., and provides third-party plan review services to jurisdictions throughout the western United States. He is a licensed structural engineer in addition to being an ICC-certified master code professional, certified building official, and fire code official and holding numerous other ICC certifications. Mr. Kimball provides training classes to help design professionals, building officials, and contractors alike to understand the requirements of the adopted building codes.

William C. Bracken, PE, SI, CFM, is the Executive Vice President and National Director of Forensic Engineering for J.S. Held. His practice has specialized in structural, building envelope, general civil, floodplain, construction, and forensic engineering projects, building applications, and urban search and rescue responses. Mr. Bracken is an instructor for the ICC Disaster Response Inspector Institute and ICC building code seminars.

How often have you heard these questions when discussing building codes: “What is the intent of this section?” or, “How do I apply this provision?” This publication offers the code user a resource that addresses much of the intent and application principles of the major provisions of the 2018 International Building Code® (IBC®).

It is impossible for building codes and similar regulatory documents to contain enough information, both prescriptive and explanatory narrative, to remove all doubt as to the intent of the various provisions. If such a document were possible, it would be so voluminous that it would be virtually useless.

Because the IBC must be reasonably brief and concise in its provisions, the user must have knowledge of the intent and background of these provisions to apply them appropriately. The IBC places great reliance on the judgment of the building official and design professional for the specific application of its provisions. Where the designer and official have knowledge of the rationale behind the provisions, the design of the building and enforcement of the code will be based on informed judgment rather than arbitrariness or rote procedure.

The information that this handbook provides, coupled with the design professional’s and building official’s experience and education, will result in better use of the IBC and more uniformity in its application. As lengthy as this document may seem, it still cannot provide all of the answers to questions of code intent; that is why the background, training, and experience of the reader must also be called on to properly apply, interpret, and enforce the code provisions.

The preparation of a document of this nature requires consulting a large number of publications, organizations, and individuals. Even so, the intent of many code provisions is not completely documented. Sometimes the discussion is subjective; therefore, individuals may disagree with the conclusions presented. It is, however, important to note that the explanatory narratives are based on many decades of experience by the authors and the other contributors to the manuscript.
Preface

Internationally, code officials and design professionals recognize the need for a modern, up-to-date building code addressing the design and installation of building systems through requirements emphasizing performance. The International Building Code® (IBC®) meets this need by providing model code regulations that safeguard the public health and safety in all communities, large and small. The 2018 IBC Illustrated Handbook is a valuable resource for those who design, plan, review, inspect, or construct buildings or other structures regulated by the 2018 IBC.

The IBC is one of a family of codes published by the International Code Council® (ICC®) that establishes comprehensive minimum regulations for building systems using prescriptive and performance-related provisions. It is founded on broad-based principles that use new materials and new building designs. Additionally, the IBC is compatible with the entire family of International Codes® published by the ICC.

There are three major subdivisions to the IBC:

1. The text of the IBC
2. The referenced standards listed in Chapter 35
3. The appendices

The first 34 chapters of the IBC contain both prescriptive and performance provisions that are to be applied. Chapter 35 contains those referenced standards that, although promulgated and published by separate organizations, are considered part of the IBC as applicable. The provisions of the appendices do not apply unless specifically included in the adoption ordinance of the jurisdiction enforcing the code.

The 2018 IBC Illustrated Handbook is designed to present commentary only for those portions of the code for which commentary is helpful in furthering the understanding of the provision and its intent. This handbook uses many drawings and figures to help clarify the application and intent of many code provisions.

The handbook examines the intent and application of many provisions for both the non-structural- and structural-related aspects of the IBC. It addresses in detail many requirements that are considered as “fire- and life-safety” provisions of the code. Found in IBC Chapters 3 through 10, these provisions focus on the important considerations of occupancy and type of construction classification, allowable building size, fire and smoke protection features, fire protection systems, interior finishes, and means of egress.

The discussion of the structural provisions in this handbook is intended to help code users understand and properly apply the requirements in Chapters 16 through 23 of the 2018 IBC. Although useful to a broad range of individuals, the discussion of the structural provisions was written primarily so that building officials, plans reviewers, architects, and engineers can get a general understanding of the IBC’s structural requirements and gain some insight into their underlying basis and intent. To that end, the numerous figures, tables, and examples are intended to illustrate and help clarify the proper application of many structural provisions of the IBC.

Because the IBC adopts many national standards by reference rather than transcribing the structural provisions of the standards into the code itself, in some cases the discussion in this handbook pertains to the provisions found in a referenced standard such as ASCE 7 or ACI 318
rather than the IBC. The structural provisions addressed focus on the general design requirements related to structural load effects; special inspection and verification, structural testing, and structural observation; foundations and soils; and specific structural materials design requirements for concrete, masonry, steel, and wood.

Questions or comments concerning this handbook are encouraged. Please direct any correspondence to handbook@iccsafe.org.

**Participation in ICC Code Development Process.** Architects, engineers, designers, builders, and other professionals can freely participate in the ICC Code Development Process by submitting proposed code changes, collaborating with colleagues in developing code language and submitting changes, participating in giving testimony, and becoming ICC members to have voting opportunities in person or online at Committee Action Hearings. The Code Development Process is conducted via the ICC’s state-of-the-art, cloud-based cdpACCESS system. Committee Action Hearings and Public Comment Hearings are broadcast live so anyone can follow the testimonies and actions taken. All building design and construction professionals are encouraged to participate in the ICC Code Development Process and have a say in the outcome of future editions of the *International Building Code* or any other of the ICC International Codes. Because architects, engineers, and other design and construction professionals apply the code to actual buildings and experience first-hand the effectiveness of code provisions, it is very critical for them to participate in the Code Development Process and improve the code each cycle.

Acknowledgments

The publication of this handbook is based on many decades of experience by the authors and the other contributors. Since its initial publication, the handbook has become a living document subject to changes and refinements as newer code regulations are released. This latest edition reflects extensive modifications based on the requirements found in the 2018 International Building Code® (IBC®).

The initial handbook, on which the nonstructural portions of this document are based, was published in 1988. It was authored by Vincent R. Bush. In developing the discussions of intent, Mr. Bush drew heavily on his 25 years of experience in building safety regulation. Mr. Bush, a structural engineer, was intimately involved in code development work for many years.

In addition to the expertise of Mr. Bush, major contributions were made by John F. Behrens. Mr. Behrens’s qualifications were as impressive as the original author’s. He had vast experience as a building official, code consultant, and seminar instructor. Mr. Behrens provided the original manuscript of the means of egress chapter and assisted in the preparation of many other chapters.

Revisions to the handbook occurred regularly over the years, with content based on the provisions of the International Building Code authored by Doug Thornburg, AIA, CBO. Mr. Thornburg, a certified building official and registered architect, has over 38 years of experience in the building regulatory profession. Previously a building inspector, plans reviewer, building code administrator, seminar instructor, and code consultant, he is currently the Vice President and Technical Director of Product Development at the International Code Council® (ICC®). In his present role, Mr. Thornburg develops and reviews technical publications, reference books, resource materials, and educational programs relating to the International Codes®. He continues to present building code seminars nationally and has developed numerous educational texts, including Significant Changes to the IBC, 2018 Edition. Mr. Thornburg was presented with the ICC’s inaugural Educator of the Year Award in 2008, recognizing his outstanding contributions in education and training.

The basis of the discussion on the structural provisions in the 2018 IBC Illustrated Handbook is the 2000 IBC Handbook—Structural Provisions, authored by S. K. Ghosh, Ph.D., and Robert Chittenden, SE. Both authors have extensive knowledge, expertise, and experience in the development of many of the structural provisions of the IBC. Dr. Ghosh initially authored Chapters 16 and 19, and Mr. Chittenden authored Chapters 17, 18, 20, 21, 22, and 23. John Henry, PE, a former ICC principal staff engineer, authored the commentary addressing IBC Chapters 16 through 23 for the past several editions. Mr. Henry was presented with the ICC’s John Nosse Award for Technical Excellence in 2011, recognizing his outstanding contributions and technical expertise. He is now a consulting engineer in private practice.

The structural provisions in relation to Chapters 16 through 23 in this edition have been updated by both William C. Bracken, PE, and Chris Kimball, SE. Mr. Bracken is a current ICC subject matter expert on curriculum development and delivery and a registered civil and structural engineer, and has 30 years of experience with structural, building envelope, general civil, floodplain, construction, and forensic engineering projects. He was also presented with the ICC’s 2017 Educator of the Year Award, recognizing his dedication to training.
Mr. Kimball is currently the Vice President of West Coast Code Consultants, Inc., in addition to providing structural training on behalf of the ICC. He is a licensed structural engineer, ICC master code professional, certified building official, and fire code official, and holds numerous other certifications. Mr. Kimball specializes in providing plan review services to jurisdictions throughout the western United States and is often asked to provide code training to building officials, design professionals, and contractors.

Great appreciation is due to Sandra Hyde, PE, ICC senior staff engineer, for her review of and input into the structural chapters in this edition.

The information and opinions expressed in this handbook are those of the present and past authors, as well as the many contributors, and do not necessarily represent the official position of the International Code Council. Additionally, the opinions may not represent the viewpoint of any enforcing agency. Opinions expressed in this handbook are only intended to be a resource in the application of the IBC, and the building official is not obligated to accept such opinions. The building official is the final authority in rendering interpretations of the code.
