Foreword ................................................................. xv
Acknowledgment .................................................. xvii

1 Introduction ......................................................... 1

2 Characteristics of Earthquakes ................................. 7
   2.1 Causes of Earthquakes ...................................... 7
   2.2 Plate Tectonic Theory ..................................... 7
   2.3 Measures of Earthquakes ................................... 9
      2.3.1 Magnitude ............................................ 10
      2.3.2 Intensity .............................................. 10
      2.3.3 Instrumental Scale .................................. 12
      2.3.4 Fourier Amplitude Spectrum ....................... 13
      2.3.5 Power Spectral Density .............................. 14
      2.3.6 Response Spectrum ................................ 14

3 Linear Elastic Dynamic Analysis .............................. 15
   3.1 Introduction ............................................... 15
   3.2 Single Degree of Freedom System ......................... 15
      3.2.1 System Formulation .................................. 15
      3.2.2 Response Spectrum of Elastic Systems .......... 18
      3.2.3 Design Response Spectrum ........................... 21
   3.3 Generalized Single Degree of Freedom .................... 24
   3.4 Multiple Degrees of Freedom System ....................... 33
      3.4.1 Multiple Degrees of Freedom System in 2D Analysis 33
      Modal Analysis ............................................ 34
      Orthogonality of Mode Shapes ............................ 35
      Caution .................................................... 38
      Importance of Modes ..................................... 56
   3.4.2 Multiple Degrees of Freedom System in 3D Analysis 57
      Combination Effect of Different Ground Motions .... 70
   3.4.3 Mass Participation in Buildings ....................... 70
   3.5 Shear Beam .................................................. 74
   3.6 Cantilever Flexure Beam ................................. 83
      Comparison between Shear Beam and Cantilever Flexure Beam 88
   3.7 Simple Flexure Beam ..................................... 90

3.8 Axial Beam ................................................. 93
3.9 Finite Element Method ............................................. 95
  3.9.1 Finite Element Concept in Structural Engineering .................. 96
  3.9.2 Stiffness Matrix (Virtual Work Approach) ....................... 96
  3.9.3 Mass Matrix (Virtual Work Approach) ............................ 102
  3.9.4 Stiffness and Mass Matrices (Galerkin Approach) .............. 103
  3.9.5 Other Matrices ............................................. 105
  3.9.6 Mass Matrix in 2D .......................................... 106
  3.9.7 Application of Consistent Mass Matrix ......................... 107
3.10 Incoherence ...................................................... 109
3.11 Problems ......................................................... 115

4 Nonlinear and Inelastic Dynamic Analysis .......................... 121
  4.1 Introduction ...................................................... 121
  4.2 Single Degree of Freedom System .................................. 123
  4.3 Numerical Methods ............................................... 123
    4.3.1 Central Differences Method ................................. 123
    4.3.2 Newmark-β Methods ....................................... 125
    4.3.3 Wilson-θ Method ........................................... 126
  4.4 Multiple Degrees of Freedom System ................................ 131
  4.5 Equivalent Linearization ......................................... 139
  4.6 Problems ......................................................... 145

5 Behavior of Structures under Seismic Excitation .................... 147
  5.1 Introduction ...................................................... 147
    5.1.1 Force-Reduction Factor, $R$ .................................. 147
    5.1.2 Ductility .................................................... 148
    5.1.3 Energy Dissipation Capacity .................................. 151
    5.1.4 Self-Centering Capacity ..................................... 151
    5.1.5 Frequency Shift ............................................. 152
    General Note ................................................... 152
  5.2 Relationship between Force Reduction and Ductility Demand .......... 152
    5.2.1 Equal Displacement Criterion ............................... 153
    5.2.2 Equal Energy Criterion ..................................... 154
    5.2.3 General Relationship between $R$ and $\mu_d$ ............... 155
  5.3 Relationship between Global Ductility and Local Ductility ............ 152
  5.4 Local Ductility Capacity .......................................... 163
  5.5 Evaluation of Monotonic Local Ductility Capacity .................... 163
    5.5.1 Monotonic Behavior of Concrete ................................ 163
    5.5.2 Monotonic Behavior of Steel .................................. 165
    5.5.3 Idealized Strain Compatibility Analysis ..................... 166
    Curvature at First Yield ......................................... 166
    Curvature at Ultimate State .................................... 167
5.5.4 General Strain Compatibility Analysis \hspace{1cm} 179
5.6 Evaluation of Cyclic Local Ductility Capacity \hspace{1cm} 185
  5.6.1 Cyclic Behavior of Concrete \hspace{1cm} 185
  5.6.2 Cyclic Behavior of Steel \hspace{1cm} 186
  5.6.3 Cyclic Strain Compatibility Analysis \hspace{1cm} 187
5.7 Precast Concrete Structures \hspace{1cm} 188
5.8 Effect of Structure Configuration on Ductility \hspace{1cm} 189
5.9 Second-Order Effect on Ductility \hspace{1cm} 190
5.10 Undesirable Hysteretic Behavior \hspace{1cm} 190
  Undesirable Hysteretic Behavior Due to Material Deterioration \hspace{1cm} 191
  Undesirable Hysteretic Behavior Due to Unfavorable Structural Configuration \hspace{1cm} 191
5.11 Effect of Axial Load on Hysteretic Behavior \hspace{1cm} 192
  5.11.1 Rigid Bar Idealization \hspace{1cm} 193
    Case 1: Rigid Bar under Axial Load and without Springs \hspace{1cm} 194
    Case 2: Rigid Bar with Springs and without Axial Load \hspace{1cm} 194
    Case 3: Rigid Bar with Springs and under Axial Load \hspace{1cm} 196
  5.11.2 Energy Dissipation Factor ($\alpha_N$) \hspace{1cm} 196
5.12 Design Considerations \hspace{1cm} 199
5.13 Capacity Design \hspace{1cm} 200
5.14 Pushover Analysis \hspace{1cm} 203
5.15 Recommended versus Undesirable Structural Systems \hspace{1cm} 204
5.16 Strain Rate \hspace{1cm} 206
5.17 Problems \hspace{1cm} 207

6 Design of Earthquake-Resistant Buildings (IBC) \hspace{1cm} 211
6.1 Introduction \hspace{1cm} 211
6.2 Definition of Structural Components \hspace{1cm} 212
  6.2.1 Seismic Base \hspace{1cm} 213
6.3 Seismic Design Category \hspace{1cm} 214
6.4 Zoning Classification \hspace{1cm} 215
6.5 Response Spectra \hspace{1cm} 216
6.6 Design Requirements of Seismic Design Categories \hspace{1cm} 217
  Seismic Design Category A \hspace{1cm} 218
  Seismic Design Category B and C \hspace{1cm} 218
  Seismic Design Category D, E, and F \hspace{1cm} 218
6.7 Earthquake-Induced Forces \hspace{1cm} 218
  6.7.1 Regularity of Structures \hspace{1cm} 220
    Horizontal Types of Irregularity \hspace{1cm} 220
    Vertical Types of Irregularity \hspace{1cm} 221
6.7.2 Simplified Lateral Force Analysis Procedure ................. 221
   Vertical Distribution of Base Shear .................... 222
6.7.3 Equivalent Lateral Force Procedure ..................... 227
   Vertical Distribution of Base Shear .................... 229
6.7.4 Modal Response Spectrum Analysis ....................... 233
6.7.5 Two-Stage Analysis Procedures .......................... 243
6.7.6 Time-History Analysis ................................ 245
6.7.7 Directional Effect ................................... 249
   Redundancy Factor ($\rho$) ............................... 250
6.8 Load Combinations ........................................ 251
6.9 Definitions and Requirements of Structural Systems ........ 259
6.10 Special Topics ............................................. 260
   6.10.1 Diaphragm Design Forces ............................ 260
   6.10.2 Torsional Effect .................................. 260
   6.10.3 Drift Limitations .................................. 261
   6.10.4 Structural Separation ............................... 262
   6.10.5 $P$-$\Delta$ Effect .................................. 262
6.11 Problems .................................................. 263
APPENDIX 6-1 .................................................. 264

7 Seismic Provisions of Reinforced Concrete Structures (ACI 318) ........................................ 269
   7.1 Introduction .............................................. 269
   7.2 Ordinary Moment Frames ................................. 270
      7.2.1 Ordinary Beams .................................... 270
         Main Reinforcement ................................. 270
         Development of Reinforcement .................... 275
         Shear Reinforcement ............................... 277
      7.2.2 Ordinary Beam-Columns ............................ 278
         Main Reinforcement ................................. 278
         Development of Reinforcement .................... 279
         Shear Reinforcement ............................... 279
   7.3 Intermediate Moment Frames ............................. 290
      7.3.1 Intermediate Beams ................................ 291
         Main Reinforcement ................................. 292
         Lateral Reinforcement ............................. 292
      7.3.2 Intermediate Beam-Columns ........................ 292
         Lateral Reinforcement ............................. 293
   7.4 Special Moment Frames ................................. 302
      7.4.1 Special Beams ..................................... 303
         Design Shear, $V_e$ ................................ 303
         Dimension Limitations .............................. 304
         Main Reinforcement ................................. 305
         Lateral Reinforcement ............................. 306

This is the third edition of a one-of-a-kind textbook. This book explains the fundamental concepts of structural dynamics and earthquake engineering with an exceptional clarity and an unprecedented quantity of numerical examples that help the reader fully understand the concepts being discussed.

Professor Armouti has done a phenomenal job of explaining the difficult concepts of linear and nonlinear dynamics and structural response to earthquake excitations. The presentation style, simplicity of language, and the vast number of examples help make the concepts presented easily understandable even to those who face them for the first time.

This is an ideal textbook for teaching a first undergraduate or graduate course in earthquake engineering. It not only explains the structural dynamics theories necessary for understanding linear and nonlinear response to earthquake excitations, but also covers the basic design of earthquake-resistant steel and reinforced concrete buildings, bridges, and isolated systems, in accordance with the latest codes of the United States. The provisions of ASCE 7 standard as well as those in the International Building Code (IBC), ACI-318, and AISC seismic provisions are clearly explained and illustrated through numerical examples.

Students of the subject will find this book easy to follow and will appreciate the wealth of numerical examples presented for every small and large issue discussed. The instructors will find this book useful because of the simplicity of the presentation, the extensive number of solved examples, and the problems contained at the end of the first five chapters. To aid instructors in using the book effectively for teaching the subject, an Instructor’s Manual containing solutions to end of chapter problems and a set of PowerPoint presentation slides are made available to qualified instructors. Last, but not the least, engineering practitioners will find this book to be an invaluable source of information regarding response of various systems and components to earthquake excitations.

When I was first presented with the manuscript of the first edition of this book by the International Code Council, which was seeking my opinion regarding potential publication in the United States, the first thought that crossed my mind was: an earthquake engineering book from Jordan for the U.S. market? This initial reaction, however, rapidly faded when I went over the contents and the presentation of the book.
Foreword

I did strongly recommend publication of the first and second editions of this textbook for the U.S. market and I am very pleased to have done the same for this third edition of the book.

Past President,
Earthquake Engineering Research Institute
I gratefully acknowledge the help, support, and encouragement received from my family, friends, and colleagues throughout Jordan and abroad which have converted my exhaustion into motivation.

THANK YOU ALL !!!
