2. The temperature of the brine is related to the climatic conditions and may vary from -5°C to 40°C.

3.2 total cooling capacity
amount of sensible and latent heat that the equipment can remove from the conditioned space in a defined interval of time, in watts, as determined by the specified test methods

3.3 net total cooling capacity
total cooling capacity with fan power adjustment
(See 4.1.3)

3.4 heating capacity
amount of heat that the equipment can add to the conditioned space in a defined interval of time, in watts, as determined by the specified test methods

3.5 net heating capacity
heating capacity with fan power adjustment
(See 4.1.3)

3.6 rated voltage
voltage shown on the nameplate of the equipment, in volts

3.7 rated frequency
frequency shown on the nameplate of the equipment, in hertz

3.8 energy efficiency ratio (EER)
ratio of the net total cooling capacity to the effective power consumed by the heat pump, using the following formula:

\[ \eta = \frac{q \times \Delta p}{\phi} \]

where
\[ q \] is the nominal airflow rate, in litres per second.
\[ \Delta p \] is the measured internal static pressure difference, in pascals.
\[ \phi \] is the measured external static pressure difference, in pascals.

This value shall be added to the heating capacity and subtracted from the cooling capacity.

3.9 coefficient of performance (COP)
ratio of the net heating capacity to the effective power input to the equipment at any given set of rating conditions, in watts per watt

3.10 standard air
dry air at 20.0°C and 101.324 kPa having a mass density of 1.204 kg/m³

3.11 effective power input
average electrical power input to the equipment within a defined interval of time, in watts; i.e., the sum of:

- the power input for operation of the compressor excluding additional electrical heating devices,
- the power input of all control and safety devices of the equipment, and
- the proportional power input of the conveying devices for the transport of the heat transfer media through the heat pump only (e.g., fans, pumps, whether internal or external, whether provided with the equipment or not)

(See 4.1.3 and 4.1.4.)

3.12 latent cooling capacity
amount of latent heat that the equipment can remove from the conditioned space in a defined interval of time, in watts

3.13 sensible cooling capacity
amount of sensible heat that the equipment can remove from the conditioned space in a defined interval of time, in watts

3.14 heating capacity
amount of heat that the equipment can add to the conditioned space in a defined interval of time, in watts

4. Rating and test conditions

4.1 Rating conditions for the determination of capacity

4.1.1 Standard ratings
Standard ratings shall be established at the standard rating conditions specified in 4.2, using the test procedures described in clause 6. Standard ratings relating to cooling and heating capacities shall be net values, including the effects of circulating-fan heat, but not including supplementary heat. Standard efficiency ratings shall be based on the effective power input as defined in 3.11.

4.1.2 Power input of fans for heat pumps without duct connection
In the case of heat pumps which are not designed for duct connection and which are equipped with an integral fan, all power consumed by the fans shall be included in the effective power input to the heat pump.

4.1.3 Power input of fans for heat pumps with duct connection

4.1.3.1 If no fan is provided with the heat pump, a fan power adjustment is to be included in the effective power input to the heat pump, using the following formula:

\[ \phi_{fa} = \frac{q \times \Delta p}{\eta} \]

where
\[ \phi_{fa} \] is the fan power adjustment, in watts;
\[ \eta = 0.3 \times 10^3 \] by convention;
\[ \Delta p \] is the measured internal static pressure difference, in pascals;
\[ q \] is the nominal airflow rate, in litres per second.

This value shall be added to the heating capacity and subtracted from the cooling capacity.

4.1.3.2 If a fan is an integral part of a heat pump, only the portion of the fan power required to overcome the internal resistance shall be included in the effective power input to the heat pump. The fraction which is to be excluded from the total power consumed by the fan shall be calculated using the following formula:

\[ \phi_{fa} = \frac{q \times \Delta p}{\eta} \]

where
\[ \phi_{fa} \] is the fan power adjustment, in watts;
\[ \eta = 0.3 \times 10^3 \] by convention;
\[ \Delta p \] is the measured external static pressure difference, in pascals;
\[ q \] is the nominal airflow rate, in litres per second.

This value shall be subtracted from the heating capacity and added to the cooling capacity.

4.1.4 Power input of liquid pumps

4.1.4.1 If no liquid pump is provided with the heat pump, a pump power adjustment is to be included in the effective power consumed by the heat pump, using the following formula:
where
\[ \phi_{pa} = \frac{q \times \Delta p}{\eta} \]

where
\( \phi_{pa} \) is the pump power adjustment, in watts; 
\( \eta = 0.3 \times 10^3 \) by convention; 
\( \Delta p \) is the measured internal static pressure difference, in pascals; 
\( q \) is the nominal fluid flow rate, in litres per second.

4.1.4.2 If a liquid pump is an integral part of the heat pump, only the portion of the pump power required to overcome the internal resistance shall be included in the effective power input to the heat pump. The fraction which is to be excluded from the total power consumed by the pump shall be calculated using the following formula:

\[ \phi_{pa} = \frac{q \times \Delta p}{\eta} \]

where
\( \phi_{pa} \) is the pump power adjustment, in watts; 
\( \eta = 0.3 \times 10^3 \) by convention; 
\( \Delta p \) is the measured external static pressure difference, in pascals; 
\( q \) is the nominal fluid flow rate, in litres per second.

4.1.5 Airflow rates

4.1.5.1 All standard ratings shall be determined at airflow rates as described below. All airflow rates shall be expressed as litres per second of standard air as defined in 3.10.

4.1.5.2 Ducted heat pumps which have integral fans shall be tested at the airflow rates specified by the manufacturer, or those obtained at zero external static pressure difference, whichever provides the lower airflow rate.

4.1.5.3 Ducted heat pumps which do not have integral fans, but which are tested in combination with a device employing a fan, shall be tested as described in 4.1.5.2. Ducted heat pumps which do not have integral fans but which are rated for general use with a variety of air moving devices, shall be tested at the airflow rates specified by the manufacturer in the published ratings. However, the pressure drop across the indoor coil assembly and the recommended enclosures and attachment means shall not exceed 75 Pa.

4.1.5.4 Non-ducted heat pumps shall be tested at the airflow rates obtained at zero external static pressure difference.

4.1.5.5 The manufacturer shall specify a single airflow rate for all tests required in this part of ISO 13256 unless automatic adjustment of airflow rate is provided by the equipment. A separate control signal output for each step of airflow rate shall be considered as an automatic adjustment.

4.1.6 Liquid flow rates

4.1.6.1 All standard ratings shall be determined at a liquid flow rate described below, expressed as litres per second.

4.1.6.2 Heat pumps with integral liquid pumps shall be tested at the liquid flow rates specified by the manufacturer or those obtained at zero external static pressure difference, whichever provides the lower liquid flow rate.

4.1.6.3 Heat pumps without integral liquid pumps shall be tested at the flow rates specified by the manufacturer.

4.1.6.4 The manufacturer shall specify a single liquid flow rate for all of the tests required in this part of ISO 13256 unless automatic adjustment of the liquid flow rate is provided by the equipment. A separate control signal output for each step of liquid flow rate will be considered as an automatic adjustment.

4.1.7 Requirements for separated assemblies

In the case of heat pumps consisting of separate matched assemblies, the following installation procedures shall be followed.

(a) Each refrigerant line shall be installed in accordance with the manufacturer’s instructions with the maximum stated length or 7.5 m, whichever is shorter. If the interconnecting tubing is furnished as an integral part of the equipment and not recommended for cutting the length, the equipment shall be tested with the complete length of tubing furnished.

(b) The lines shall be installed without any significant difference in elevation (not more than 2 m).

4.1.8 Requirements for heat pumps with capacity control

4.1.8.1 Part-load conditions shall be used for rating tests at levels or steps less than that of maximum capacity.

4.1.8.2 Heat pumps with fixed steps of capacity control shall be rated at each step of capacity. Heat pumps with variable capacity control shall be rated at no less than two capacity levels, the minimum and the maximum capacities.

4.1.9 Test liquids

4.1.9.1 The test liquid for water-loop heat pumps and ground-water heat pumps shall be water.

4.1.9.2 The test liquid for ground-loop heat pumps shall be a 15% solution by mass of sodium chloride in water.

4.1.9.3 The test liquid shall be sufficiently free of gas to ensure that the measured result is not influenced by the presence of gas.

4.2 Standard rating and part-load rating test conditions

4.2.1 The test conditions for the determination of standard and part-load cooling ratings are specified in Table 1.

4.2.2 The test conditions for determination of standard and part-load heating ratings are specified in Table 2.

4.2.3 Heat pumps intended for a specific application shall be rated at the conditions specified for that application, for example, water-loop, ground-water, or ground-loop, and shall be identified as such (i.e., water-loop heat pump, ground-water heat pump, or ground-loop heat pump). Heat pumps intended for two or three applications shall be rated at the conditions specified for each of these applications and shall be so identified (see 7.3).

4.2.4 For each test, the equipment shall be operated continuously until equilibrium conditions are attained, but for not less than one hour before capacity test data are recorded. The data shall then be recorded for 30 min at 5-min intervals until seven consecutive sets of readings have been attained within
the tolerances specified in 6.4. The averages of these data shall be used for the calculation of the test results.

5. Performance requirements

5.1 General

5.1.1 To comply with this part of ISO 13256, water-to-air and brine-to-air heat pumps shall be designed and produced such that any production unit will meet the applicable requirements of this part of ISO 13256.

5.1.2 For heat pumps with capacity control, the performance requirements tests shall be conducted at maximum capacity.

5.2 Maximum operating conditions test

5.2.1 Test conditions

The maximum operating conditions tests shall be conducted for cooling and heating at the test conditions established for the specific applications (see 4.2.3) specified in Tables 3 and 4. Heat pumps intended for use in two or more applications shall be tested at the most stringent set of conditions specified in Tables 3 and 4.

5.2.2 Test procedures

5.2.2.1 The equipment shall be operated continuously for one hour after the specified temperatures have been established at each specified voltage level.

5.2.2.2 The 110% voltage test shall be conducted prior to the 90% voltage test.

5.2.2.3 All power to the equipment shall be cut off for 3 min at the conclusion of the one hour test at the 90% voltage level and then restored for one hour.

5.2.3 Test requirements

Heat pumps shall meet the following requirements when operating at the conditions specified in Tables 3 and 4.

5.2.3.1 During the entire test, the equipment shall operate without any indication of damage.

5.2.3.2 During the test period specified in 5.2.2.1, the equipment shall operate continuously without tripping any motor overload or other protective devices.
During the test period specified in 5.2.2.3, the motor overload protective device may trip only during the first 5 min of operation after the shutdown period of 3 min. During the remainder of the test period, no motor overload protective device shall trip. For those models so designed that resumption of operation does not occur within the first 5 min after the initial trip, the equipment may remain out of operation for no longer than 30 min. It shall then operate continuously for the remainder of the test period.

5.3 Minimum operating conditions test

5.3.1 Test conditions

Heat pumps shall be tested at the minimum operating test conditions for cooling and heating at the test conditions established for the specific applications (see 4.2.3) specified in Tables 5 and 6. Heat pumps intended for use in two or more applications shall be tested at the most stringent set of conditions specified in Tables 5 and 6.

5.3.2 Test procedures

For the minimum operating cooling test, the heat pump shall be operated continuously for a period of no less than 30 min after the specified temperature conditions have been established. For the minimum operating heating test, the heat pump shall soak for 10 min with liquid at the specified temperature circulating through the coil. The equipment shall then be started and operated continuously for 30 min.

5.3.3 Test requirements

No protective device shall trip during these tests and no damage shall occur to the equipment.
